<u>Mapping against reference genome and Variant Calling :</u>

- Mapping vs Alignment
- What is mapping?
- How to choose a NGS mapper.
- SAM/BAM format
- Duplicate filter
- Variant Calling
- Source of error and mitigation strategies
- VCF and bed format
- GATK vs VARSCAN2
- High quality SNP selection

Secuenciación de genomas bacterianos:
herramientas y aplicaciones

Alignment

Definition:
Arrange two or more nucleotide or aminoacid sequences to identify regions of similarity that may be a consequence of functional, structural, or evolutionary relationships.

```
AAB24882   TYHMCQFHCRYVNNHSGEKLYECNERSKAFSCPSHLQCHKRRQIGEKTHEHNQCGKAFPT

AAB24881   HSHLQCHKRTHTGEKPYECNQCGKAFSQHGLLQRHKRTHTGEKPYMNVINMVKPLHNS
```

Multiple alignment (MSA)

Definition:
A multiple alignment is a colection of three or more sequences partial or completely aligned.

Mapping definition

> ## Definición:
> Place a sequence inside a larger sequence. For example, determine the position of a read inside a reference genome.

```
        Referencia/ genoma

  GCCGGCAATTCG
```

Alignment vs mapping

Mapping:

- A mapping is regarded to be correct if it overlaps the true region.
- Each read maps independently
- From thousand to millions of sequences.

Multiple alignment:

- An alignment is regarded to be correct only if each base is placed correctly.
- Minimizes differences among sequences
- From tens to hundred of sequences.

Consideratiosn:

- An algorithm can be good at mapping but may not be good aligning.
- This is because the true alignment minimizes differences between reads, but the read mapper only sees the reference.

Hen Li. Mapping, Alignment and SNP Calling. MPG Next Gen Workshop 2011

Secuenciación de genomas bacterianos: herramientas y aplicaciones

So in summary…

CTGACCTCATGTGATCCACCCGCCTTGGCC

Find best match for the read
in a reference sequence

TGATCCAC

Challenges

- Errors in reads
- Errors in libraries
- Repetitive regions (repeats, homologous regions)
- Homopolymers
- Individual polymorphisms

Pierre Lechat. Variants Calling lecture. Pasteur.fr

What mapper should I use?

Mappers:

- Más de 60 mappers available.

- Lots of papers reviewing its performamnce.

Secuenciación de genomas bacterianos: herramientas y aplicaciones
What mapper should I use?

Cosas a tener en cuenta:

- Computational resources vs sensibility
- Platform and type of experiment (Illumina/454/etc,paired-end,DNA/RNA/etc)
- Variation (indels allowance, mistmatch number,etc.)
- Repetitions (all regions, best match, random, user defined number…)

Importante:

- Default options don't have to be the best:

"… there is no tool that outperforms all of the others in all the tests. Therefore, the end user should clearly specify his needs in order to choose the tool that provides the best results." - Hatem et al *BMC Bioinformatics* 2013, **14**:184

Secuenciación de genomas bacterianos: herramientas y aplicaciones

What mapper should I use?

Bowtie2 manual.

BWA MEM

SMEM strategy

- Maximal exact match (MEM): an exact match that cannot be extended further in either direction
- Super-maximal exact match (SMEM): a MEM that is not contained in any other MEMs on the query coordinate (Li, 2012). At any query position, the longest exact match covering the position must be a SMEM.

Seed-and-extend algorithm

Local alignment

Hen LI. Aligning sequence reads, clone sequences and assembly con*gs with BWA-MEM. Poster. Broad Institute.

BOWTIE2

End-to-end alignment by default.

Three reporting modes:
- Best alignment
- K alignments
- All alignments

Lots of customizable parameters that change its performance.

Secuenciación de genomas bacterianos:
herramientas y aplicaciones

Example whole genome aligner: MUMMER

- **<u>Maximal Unique Matcher (MUM)</u>**
  - match <- exact match of a minimum length
  - maximal <- cannot be extended in either direction without a mismatch
  - unique
    - occurs only once in both sequences (MUM)
    - occurs only once in a single sequence (MAM)
   - occurs one or more times in either sequence (MEM)

Adam M. Phillippy. Whole Genome Alignment with MUMmer. Presentation.

Secuenciación de genomas bacterianos: herramientas y aplicaciones

Example whole genome aligner: MUMMER

MUM : maximal unique match ———————————

MAM : maximal almost-unique match – – – – – – –

MEM : maximal exact match ·················

Adam M. Phillippy. Whole Genome Alignment with MUMmer. Presentation.

Example whole genome aligner: MUMMER
Adam M. Phillippy. Whole Genome Alignment with MUMmer. Lecture.

Secuenciación de genomas bacterianos:
herramientas y aplicaciones

Which aligner should I use for aligning reads agains a complete genome for variant calling?

Reference genome

Reads mapping uniquely

Read mapping equally in two
repetitive regions:
- MAPQ = 0
- Generate FP variant calls

Secuenciación de genomas bacterianos:
herramientas y aplicaciones

Homologus/repetitive region

Reads mapping to the repetitive/homologus region map against all alleles.
We allow one read to map to **several locations**.

Resistance gene - Allele 1
Reads mapping uniquely only map in Allele 1. Which is the one more **covered**
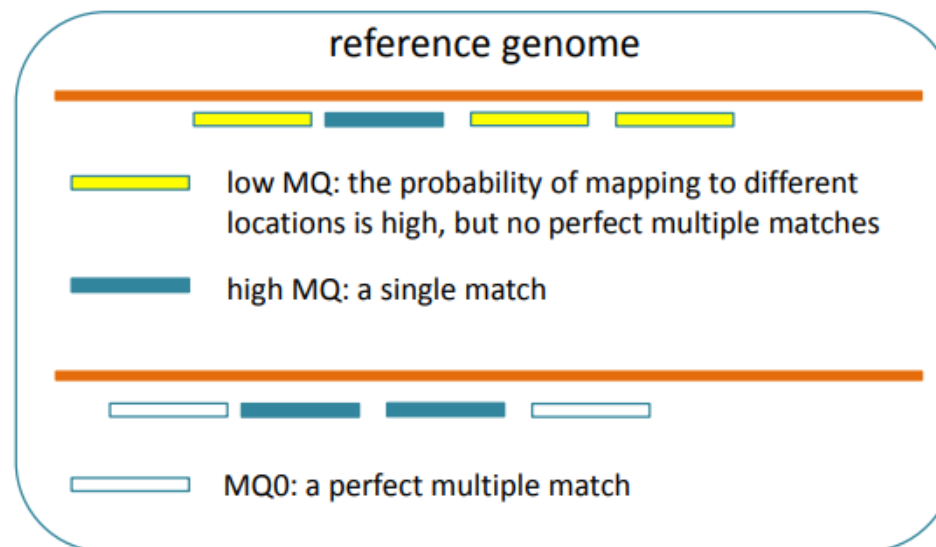

Resistance gene - Allele 2

Resistance gene - Allele 3

MAPQ

- What if there are several possible places to align your sequencing read? This may be due to:
  - Repeated elements in the genome
  - Low complexity sequences
  - Reference errors and gaps

  MQ is a phredScore of the quality of the alignment

Secuenciación de genomas bacterianos: herramientas y aplicaciones

>_BU-ISCIII

MAPQ

MAPQ is <u>NOT</u> comparable among mappers.

BWA:

- MAPQ represents the probability of the read to be mapped correctly.
- MAPQ = 0 identifies unmapped reads and…

  Reads mapping to different locations!

BOWTIE2:

- MAPQ represents the "uniqueness" of the read. A MAPQ < 10 indicates that there is at least a 1 in 10 chance that the read truly originated elsewhere
- MAPQ = 0 identifies unmapped reads

SAM format

Definición:
It's a specification that defines a generic format for storing nucleotide alignments. It describes a query alignment against a reference genome.

```

SAM format: flags

Bit	Description
0x1	template having multiple segments in sequencing
0x2	each segment properly aligned according to the aligner
0x4	segment unmapped
0x8	next segment in the template unmapped
0x10	SEQ being reverse complemented
0x20	SEQ of the next segment in the template being reversed
0x40	the first segment in the template
0x80	the last segment in the template
0x100	secondary alignment
0x200	not passing quality controls
0x400	PCR or optical duplicate
0x800	supplementary alignment

SAM format: CIGAR string

Op	BAM	Description
M	0	alignment match (can be a sequence match or mismatch)
I	1	insertion to the reference
D	2	deletion from the reference
N	3	skipped region from the reference
S	4	soft clipping (clipped sequences present in SEQ)
H	5	hard clipping (clipped sequences NOT present in SEQ)
P	6	padding (silent deletion from padded reference)
=	7	sequence match
X	8	sequence mismatch

Secuenciación de genomas bacterianos:
herramientas y aplicaciones

SAM vs BAM format

- SAM and BAM format are exactly the same.
  - SAM is a tabular plain text file.
  - BAM is its binary format. Binary meaning is in a compress format not human readable.
  - We **MUST** always use BAM format because it is optimized for computer-reading

AND

BECAUSE IT SAVES A LOT OF DISK SPACE!!

Typical bam and sam format files weights from a S. grumpensis
SAM format file: 3.6 GB
BAM format file: 689 M

Secuenciación de genomas bacterianos: herramientas y aplicaciones

Duplicate filter

- Duplicates are non-independent measurements of a sequence
  - Sampled from the exact same template of DNA
  - Violates assumptions of variant calling
- Errors in sample/library prep will get propagated to all the duplicates
- Just pick the "best" copy – mitigates the effects of errors
- **Definition**: sequences starting and finishing in the exact same coordinates. Both pairs if paired-end.

Secuenciación de genomas bacterianos:
herramientas y aplicaciones

Duplicate filter

Secuenciación de genomas bacterianos:
herramientas y aplicaciones

Mapping statistics

- % mapped: reads mapped/total reads

- % unmapped: reads unmapped/total reads

- % duplicates: reads belonging to same template/total

  reads

- Mean depth of coverage

- Coverage: % genome with at least one read mapped.

Secuenciación de genomas bacterianos:
herramientas y aplicaciones

Depth of coverage vs coverage

Breadth of coverage

How much of a genome is "covered" by short reads? Are there regions that are not covered, even not by a single read?

Breadth of coverage is the percentage of bases of a reference genome that are covered with a certain depth. For example: 90% of a genome is covered at 1X depth; and still 70% is covered at 5X depth.

Depth of coverage

How strong is a genome "covered" by sequenced fragments (short reads)?

Per-base coverage is the average number of times a base of a genome is sequenced. The coverage depth of a genome is calculated as the number of bases of all short reads that match a genome divided by the length of this genome. It is often expressed as 1X, 2X, 3X,... (1, 2, or, 3 times coverage).

www.metagenomics.wiki
Variant Calling

- **Variant calling concept is simple:**

  Find positions in our reads different from the reference.

- We start with our secuences mapped against our reference genome, and we walk trough every column of the alignment counting the number of alleles found and comparing them against the reference.

Secuenciación de genomas bacterianos:
herramientas y aplicaciones

Sources of error and mitigation strategies

Sample processing
- Polymerase error

Sequencing
- Polymerase error
- Sequencing chemistry
- Reaction detection.
- Base calling

Read Mapping
- Genome duplication
- Structural variants

SNP Calling
- Base Quality scores
- Mapping quality scores
- Filtering thresholds

Adapted from Olson et al. Frontiers in Genetics. 2015

Secuenciación de genomas bacterianos: herramientas y aplicaciones

Sources of error and mitigation strategies

- **<u>Sample processing errors.</u>**
  - Random errors.
  - Associated with polymerase errors . (1 in 10^{2-3} bases)
  - Homopolymers and tandem repeats experience higher indel error rates.
- **<u>Solutions:</u>**
  - Paired-end libraries.
  - Minimization of PCR cycles.

Adapted from Olson et al. Frontiers in Genetics. 2015

Sources of error and mitigation strategies

- **<u>Sequencing:</u>**
  - Dependent on the platform.
  - Can be random and systematic.
  - 6% Illumina, 50% Roche (Ross et al.2013)
  - P.e Illumina commits error in the G/T channels.

- **<u>Solutions:</u>**
  - Strand bias.

Adapted from Olson et al. Frontiers in Genetics. 2015

# Sources of error and mitigation strategies

- **<u>Mapping errors:</u>**
  - Genomic duplication and structural variation.
  - High diverse areas.

- **<u>Solutions</u>**
  - Paired-end libraries.
  - Long reads / fragments.
  - MAPQ
  - Realignment around indels.

Adapted from Olson et al. Frontiers in Genetics. 2015

Secuenciación de genomas bacterianos: herramientas y aplicaciones

Sources of error and mitigation strategies

Secuenciación de genomas bacterianos:
herramientas y aplicaciones
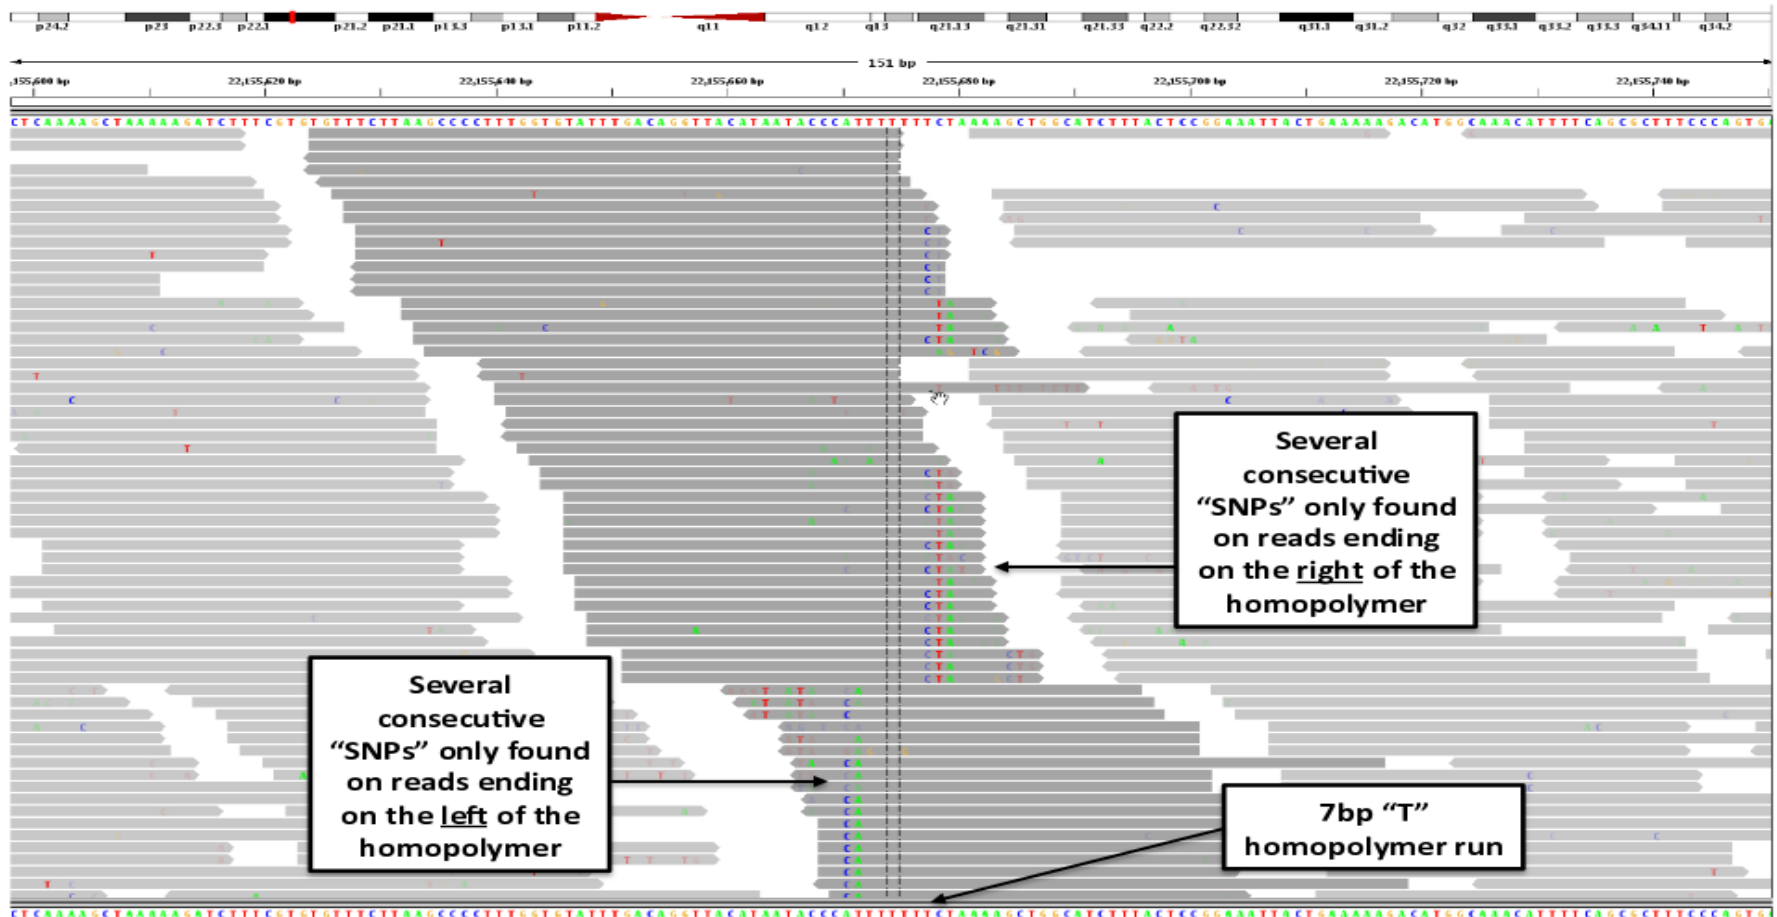

Sources of error and mitigation strategies

Sources of error and mitigation strategies

- **SNP calling step**
  - Errors may result in base calling errors.
  - FP and FN calls.
- **Solutions**
  - Strand bias
  - Base quality rank sum
  - MAPQ
  - Hard filters:
    - Depth of coverage
    - Minimun base call frequency.

Adapted from Olson et al. Frontiers in Genetics. 2015

Secuenciación de genomas bacterianos:
herramientas y aplicaciones

Reference selection

- Critial step <- Bias which SNPs are called.
- SNPs in genes not present in the reference **WON'T** be called.
- Less effect in clonal bacteria.
- Number of SNPs called vary **A LOT!**

- **Solutions:**
  - Kmerfinder

Secuenciación de genomas bacterianos:
herramientas y aplicaciones

Repetitive/Phage regions filtering

- **<u>PHASTER</u>**

- We can remove/mask phague/repetitive regions where reads won't map.
- This way those areas will be out of analysis.
- Problem: those areas could be important!

GATK
Best Practices for Germline SNPs and Indels in Whole Genomes and Exomes - June 2016

GATK

- **1. Define active regions**
  - The program determines which regions of the genome it needs to operate on, based on the presence of significant evidence for variation.

- **2. Determine haplotypes by assembly of the active region**
  - For each ActiveRegion, the program builds a De Bruijn-like graph to reassemble the ActiveRegion, and identifies what are the possible haplotypes present in the data. The program then realigns each haplotype against the reference haplotype using the Smith-Waterman algorithm in order to identify potentially variant sites.

- **3. Determine likelihoods of the haplotypes given the read data**
  - For each ActiveRegion, the program performs a pairwise alignment of each read against each haplotype using the PairHMM algorithm. This produces a matrix of likelihoods of haplotypes given the read data. These likelihoods are then marginalized to obtain the likelihoods of alleles for each potentially variant site given the read data.

- **4. Assign sample genotypes**
  - For each potentially variant site, the program applies Bayes' rule, using the likelihoods of alleles given the read data to calculate the likelihoods of each genotype per sample given the read data observed for that sample. The most likely genotype is then assigned to the sample.

Best GATK practice guide.

Cohorts need to be analyzed together at variant calling step

- If we simply call variants on individual samples then merge lists of their variants, we miss a lot of important information

Individual callsets

Underpowered analysis

- Joint variant discovery rescues a lot of valuable information
Joint callset

Empowered analysis

Sequencing and variant calling pipelines MPG Primer @ Broad Institute Cambridge, 15 October, 2015

Joint analysis empowers calls in difficult sites
- If we analyze Sample #1 or Sample #N alone we are not confident that the variant is real

- If we see both samples then we are more confident that there is real variation at this site in the cohort

Sequencing and variant calling pipelines MPG Primer @ Broad Institute Cambridge, 15 October, 2015
GATK problems

- Haploid variant calling is a side project. GATK is mainly for diploid organism, and the development and improvement of the haploid algorithm is slow.

- Manual filtering is needed for high quality SNPs selection.

Secuenciación de genomas bacterianos: herramientas y aplicaciones

VARSCAN2

- Uses a heuristic/statistic method instead of bayesian.
- Allows more flexibility and hard filters.
- Used in many bacterial variant calling pipelines. P.e CFSAN snp-pipeline.
